Professional Summary

DevOps Engineer with hands-on experience automating and securing production infrastructure on AWS. Designs, automates, and secures AWS infrastructure using Terraform, Docker, Kubernetes, and GitHub Actions. Currently supporting production operations, incident RCA, and change management at TCS.

Technical Skills

Cloud & Networking: AWS (EC2, VPC, ALB, Auto Scaling, RDS, ECR, S3, IAM, SSM, CloudWatch, Route 53), Load Balancing, DNS, Reverse Proxy (Nginx), Multi-AZ Architecture

Infrastructure as Code: Terraform (Modules, Remote State, Plan/Apply Workflows)

CI/CD & Containers: GitHub Actions, Jenkins, Argo CD (GitOps), Docker, Docker Compose, Kubernetes, Helm

Monitoring & Observability: Prometheus, Grafana, Kibana, Node Exporter, cAdvisor, Autosys, Incident Management

Security & Quality: Trivy, SonarQube, IAM, GitHub OIDC

Programming & Scripting: Python, Bash, SQL, YAML

Databases & Caching: PostgreSQL, Redis, MySQL, MongoDB

Tools: Linux, Git, GitHub, Maven, Nexus, Postman

Experience

DevOps / Application Operations Engineer

Apr 2025 – Present

Tata Consultancy Services (TCS), Kochi, Kerala

- Investigate production incidents using Grafana dashboards and Kibana log analysis, performing Root Cause Analysis (RCA) to identify recurring issues and support long-term fixes.
- Troubleshoot Autosys batch job failures by analysing logs, validating job dependencies, and coordinating with application teams to restore business-critical workflows.
- Execute production Change Requests (CRQs) following organisational change management processes, including pre-change validation, deployment, post-change verification, and rollback readiness.
- Resolve production issues involving application failures, disk-space exhaustion, service availability, and backend connectivity while meeting agreed SLA commitments.
- Collaborate with cross-functional teams to restore services quickly and document incident resolutions for future reference.

Projects

Production-Ready URL Shortener on AWS

2026

- Designed a multi-tier AWS architecture with modular Terraform – custom VPC, multi-AZ public/private subnets, ALB, Auto Scaling EC2, RDS PostgreSQL – using remote state in S3 for team-safe collaboration.
- Built a GitHub Actions CI/CD pipeline (test, lint, Docker build, Trivy scan, ECR publish, Terraform apply, health check) authenticated via AWS OIDC, with no long-lived access keys.
- Containerized a FastAPI service with multi-stage Docker builds; integrated Redis using cache-aside caching to reduce PostgreSQL read load.
- Configured ALB health checks and Auto Scaling-based instance recovery with private subnets isolating application and database tiers.
- Implemented observability with Prometheus and Grafana, exposing request latency, cache hit ratio, and infrastructure metrics to reduce troubleshooting time.
- Hardened the deployment with non-root containers, scoped IAM roles, SSM Session Manager (no SSH exposure), and automated vulnerability scanning.

Stack: AWS, Terraform, Docker, GitHub Actions, FastAPI, PostgreSQL, Redis, Prometheus, Grafana, Trivy

CodeStep – Real-Time Collaborative Coding Platform

2025

- Built a GitOps deployment pipeline with GitHub Actions (build/push) and Argo CD (Kubernetes sync) for a containerized full-stack application.
- Deployed a Dockerized full-stack app to Kubernetes with a MongoDB backend and REST APIs.

Stack: Docker, Kubernetes, Argo CD, GitHub Actions, Node.js, MongoDB, REST APIs

Certifications

- KodeKloud DevOps Engineer

Education

B.Tech in Computer Science and Engineering

2020 – 2024

APJ Abdul Kalam Technological University, SCMS School of Engineering and Technology

CGPA: 7.89
